# TouchDown

TouchDown is the best selling Exchange Synchronization solution for the Android platform. It was the first ever solution to provide Exchange access on the Android platform.

Released in November 2008, TouchDown has undergone dozens of customer-driven revisions to reach the current state. TouchDown has been rated highest consistently in the Android Market and has enjoyed the loyal support of thousands of happy customers.

TouchDown is available on the Android Market as well as a separate download from [www.nitrodesk.com](http://www.nitrodesk.com). It provides the user with a 5 day, full feature trial.

## Features

TouchDown supports most of the features a full-fledged Exchange Sync Client is expected to have. The following is a high level list

- Security

    - Exchange 2003/2007/2010
    - Kerio
    - Zimbra
    - Lotus Notes Traveler 8.5.1 (Beta)

## Built for Business

**T**ouchDown goes a long way to make the Android platform ready for businesses.

**A**ctiveSync Security policies enable administrators to specify a PIN which is enforced by TouchDown prior to giving users access to Exchange Data. This PIN can additionally be made more robust using complexity policies as well as idle timeouts between prompting. TouchDown supports Remote Wipe of exchange data, whether the data resides on the device or is held on the SD card.

**T**ouchDown can be used in conjunction with other applications which are capable of reading or editing documents such as PDF, Word, Excel etc, enabling the user to open email attachments of different types.

**T**ouchDown also enables more comprehensive coverage of Exchange features such as categorization of events, tasks and contacts, as well as setting and clearing Out Of Office messages.
